

MATERIAL LIFE CYCLES

Waste to Landfill

DID YOU KNOW?

- The average American creates 4.38 lbs of garbage per day.
- 135 million tons of garbage went to American landfills in 2012.
- Landfills create 17.5% of all man-made methane gas. Methane contributes to global warming.
- Materials that are dumped at a landfill never enter the economic market again. This causes us to use more of Earth's precious finite resources and in so doing use more energy and create more pollution.
- We can take better care of the planet by practicing the 5Rs: Reduce, Reuse, Refuse, Rot (compost) and Recycle!
